BIGFATPHOENIX INTERACTIVE

Company Overview and Problem Statement

Premise

Game-based learning app focused on SEL that helps children:

- Build **life skills**
- Develop **self-awareness** about decisions they make
- Become socially and emotionally intellectual in a **fun** way

Key Features

- Conversational **Role-playing** and adventure games
- Challenging and thoughtful **choices**
- **Value-based** dilemmas

Insights

- Social-Emotional Learning (SEL) market is projected to reach **USD 6.51 Billion** by 2028.
- The market is also growing at a **CAGR of 24%** from 2021 to 2028.
- Parents are increasingly recognizing the need for SEL in wake of **mental health issues** caused due to the pandemic

Competitors

- **Fairside does not have any direct competitors**, however in the field of teaching children SEL in a fun-interactive way, there are multiple start-ups working on his objective just through different mediums.
- Ex: Wisdom World of Emotions, Classcraft

Problem at Hand

Currently, we are seeing that only 20% of the players who start their first game are completing it.

- What would be the best way to ascertain **what percent of our first session players are parents** and what percent are kids, other than simply putting in an "I am a parent/kid" type dialogue box?
- How could we ensure that **parents are actually passing on the product** to their kids to play with?

Goal

1. **Ascertain the user** who is playing the games
2. **Increase user retention** and **app engagement**

Customer Segmentation

- In India, **61% of the parents** agreed that **online games are beneficial to kids**. 60% of the parents also believe that online gaming can be a great stress buster for kids. [1]
- SEL Interventions have made their way into the Indian Education System [2] thus **furthering the interest of parents** to have their kids use SEL based video games: at the intersection of recreation and learning.
- USA is the biggest market for SEL while India offers the best in access and scalability.
- Thus, we arrive at our **primary user persona**: girls aged 9-12 years old. Our target audience however is parents of these children, leading to a parent user persona: Progressive/liberal parents focused on holistic learning

BIGFATPHOENIX
INTERACTIVE

User Persona

I want holistic development for my child!

Sanjay

I'm a curious child!

Myra

Demographics

- Sanjay is a 40-year-old financial accountant living in Pune
- He is currently leading the finance for a real-estate company

- Myra is a 10-year-old enthusiastic child who likes reading, painting and visual learning activities.

Goal

- Wants their child to develop a holistic personality including **life skills**
- Believes in **SEL learnings** as much as academic learnings

- Myra finds her dad to be her inspiration and wishes to be like him when she grows up.
- She loves **group activities** and taking **leadership roles** in them with her friends.

Pain Points

- Lack of SEL skill building in school
- Wishes for Myra to **enjoy learning** and find it fun
- Wants to **track her progress** to ensure optimal utilization of her time
- Wants a **personalized approach** to her personality development & learning as opposed to a mass-learning approach which schools already offer

- Myra doesn't want to study all the time
- She looks to her parent's cell phone as a source of entertainment which gives her **instant rewards for doing actions**
- She **doesn't want** to spend free time learning things in a **traditional way**

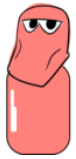

BIGFATPHOENIX INTERACTIVE

User Journey

	ONBOARDING	SELECTION	GAMEPLAY	FEEDBACK
USER EXPECTATION	User(parent) wants to provide a **gamified learning experience** to their child	**Browse** through various stories available	User reads through the story and is faced with **choices** to be made	User expects a response on the basis of the action that the user has taken in the game
CALL TO ACTION	User(parent) downloads the app and goes through the **onboarding**	**Choose** a story to start playing (user: child/parent)	User needs to tap on the screen for the next prompt and **select a choice** each time a question is presented	User clicks on "**My persona**" to see the performance and personality report
PAIN POINTS	**Lack of clarity** leads to user(parent) playing some games to understand if it's of value to their child	**No structured roadmap** or story description which helps the user(parent) decide which game(s) are the best for their child	Some stories are too **text-heavy** with the first choice coming in after a long time	The results are always just showing where the user(Child) stands in terms of the 4 personality traits **reducing incentive to continue** as learning isn't personalized or invigorating
INTERVENTION	Provide a **structured onboarding process** to show visually the process, goal and **outcomes** of this SEL based learning	**Personalize** the app interface to each user along with personalizing the roadmap: present the first story which is unique to each user (parent)	**Gamify** the story progression through rewards and continuous feedback on the progress made by the child in the story	Expand the results to provide a more **holistic progress status** on child's development for the user(parent) to be able to track improvement and have incentive to continue

BIGFATPHOENIX INTERACTIVE

Proposed Solutions

Problem	Approach	Solution	Implementation Plan	Type
How to ascertain who is playing?	 KIND	Reading Speed	• Leveraging the **difference between reading speeds of a child and an adult**, we can identify whether the person playing in a particular session is a child or an adult • **Average time to read a story line will be used as the metric** to compare the reading capabilities and will be analyzed for every session using analytical events	Analytics
	 NOBLE	Parent Section	• **Separate section for parents** to separate out use case for parent and child. This will help split approximate time spent by parent and child on the application • Child section would contain **stories, past progress, persona** • Parent section would contain **app statistics** (like time spent on the app, **progress reports**), **detailed personality reports,** subscription and payment options	Feature
How to ascertain parents are passing on the game to their child?	 SENSIBLE	Personalized app interface	• Currently, 80% of the new users play "X marks the spot" as the first story by virtue of being at the front of the story carousel. • To improve new user game completion %, following solutions are proposed: ○ **Short tutorial to understand the navigation of stories** ○ **Personalized roadmap of games/stories** ○ **Progress reports** to show child's progress in their SEL goals	Feature
	 CRAFTY	Gamification and Rewards	• Currently, user reward is delayed till the end of a story. This creates an imbalance between user action and feedback • The Gamification feature will include a **constant progress meter** which will keep track of the child's performance as he/she navigates through the story • Based on child's performance in the story, he/she will **unlock new avatars, new backgrounds**, win trophies and get appreciation certificates	Feature

KIND

BIGFATPHOENIX INTERACTIVE

Reading Speed Check (Parent or Child?)

Problem at Hand

To determine if user playing a story if a parent or a child

Key Differentiating Factor [3]

Reading speed of a 9-year-old

Range=120-180 words/min

Mean= 150 words/min

Reading speed of Adult

Range=220-350 words/min

Mean=285 words/min

Solution

Compare time taken by the user to complete first 'x' lines of the story with benchmarking data for a child and an adult

Benchmarking Data

Story

X Marks the spot

(played by 80% of the new users[4])

Number of lines =10

Number of words (approx.) = 90 words

Type of User	Number of Words	Time Taken
Adult	90 words	20-25 seconds
Child	90 words	40-45 seconds

Implementation Plan

1. Calculate time taken by an adult to complete first 10 lines of the story in a controlled environment
2. Repeat the same for a child (9–12-year-old) in a controlled environment free of distractions
3. Calculate time taken to complete first 10 lines of the story
4. Compare it to the benchmarking data to identify if it's a child or a parent playing the game

Tech Strategy

Time taken to complete 10 lines

A- % game progress after 10 lines
B- Time taken to complete A% progress

'B' to be calculated using analytic events on Call to action (Next) button within the story

[4]- As mentioned on slack channel

NOBLE

BIGFATPHOENIX INTERACTIVE

Parent Section

User Journey

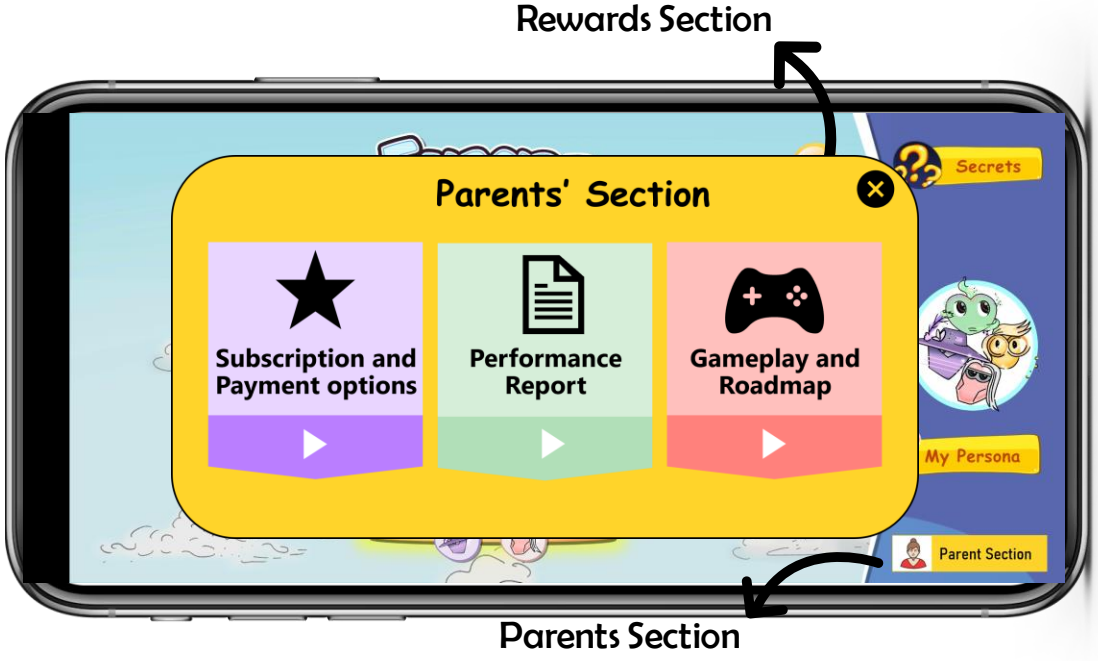

- An additional page for parents which shows child's progress in a structured format and **monitors gameplay**
- Story roadmap with tangible **future goals** to be shown post completion of questionnaire. User(parent) to be led to creating an account for tracking progress hereon.
- User(parent) asked to **switch to child mode** and start the gamified-learning journey with their child
- **Kids section** to show the available story to be played, rewards earned, brief summary of their personality traits, and an overview of games yet to be unlocked
- To improve the roadmap, **regular feedback** to be taken from parents. Children's playing behavior to also be analyzed to understand the child's interests at a deeper level
- **App statistics** (like time spent on the app, **progress reports**), **detailed personality reports,** subscription and payment options to be visible on "parents' section"

Reasoning

•An additional page for parents will show a structured roadmap to parents providing incentive to continue thus **increasing stickiness**

•Bifurcation into two sections will allow us to track parent app behavior and child app behavior separately improving **user engagement**

•Focused onboarding will **reduce churn rate and increase user engagement[5]**

SENSIBLE

BIGFATPHOENIX INTERACTIVE

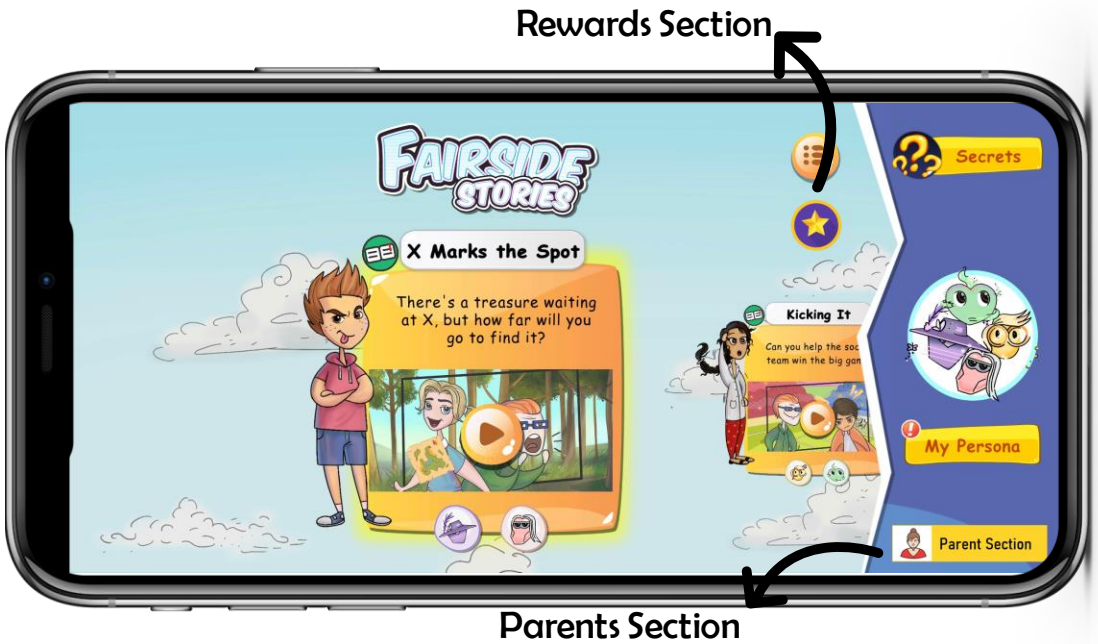

Personalized App Interface & Roadmap

User Journey

- Once the app is downloaded, a short 20-second video introduces the app, its interface, and the features in each of the kids and parent sections. **Tutorial** would be **followed by a user reward** to improve engagement and increase the likelihood of trying out a story.
- Once on the "parents' profile", a CTA on watching the video is asking the parent to begin their child's learning journey by answering a **short questionnaire** on their child's interests and goals
- Based on these goals, a **personalized roadmap using AI** will be made listing games to be played and unlocked in a sequential manner.
- **Progress reports** to be updated continuously showing personality trait division of the child among the 4 spirits: Kind, Noble, Sensible, Crafty

Reasoning

- Once parents go through the tutorial they will feel more comfortable handing over the app to their kids directly instead of trying to play the game themselves to understand it better, **reducing friction**
- Customizability & personalization can improve net promoter score by up to 20%[6], **increasing user base**
- Hyper-personalization makes it difficult to switch apps, **increasing stickiness and retention rate[7]**

CRAFTY

BIGFATPHOENIX INTERACTIVE

Gamification and Rewards

User Journey

In-App

- On the home screen, user sees a call-to-action button which points opens the rewards section. **Rewards section** would contain different types of rewards like:
  - New Avatar
  - Game Backgrounds
  - In game coins to unlock new stories
  - Trophies (on completing stories and challenges)
- Users would unlock new rewards on completing stories, tasks within the stories and by referring the game to their fellow friends

In-Game

- While navigating through a story, users will see a **progress meter** to keep track of their current status in the story. This meter will tell the progress as well as inform the users about the upcoming tasks in the story
- Through in game choices, users will unlock new rewards in the form of **mystery box, surprise box, extra lives** etc. to ensure **continuous engagement** with the user. Some of the prizes will be directly applicable within the game while other would be stored in the rewards section for future use

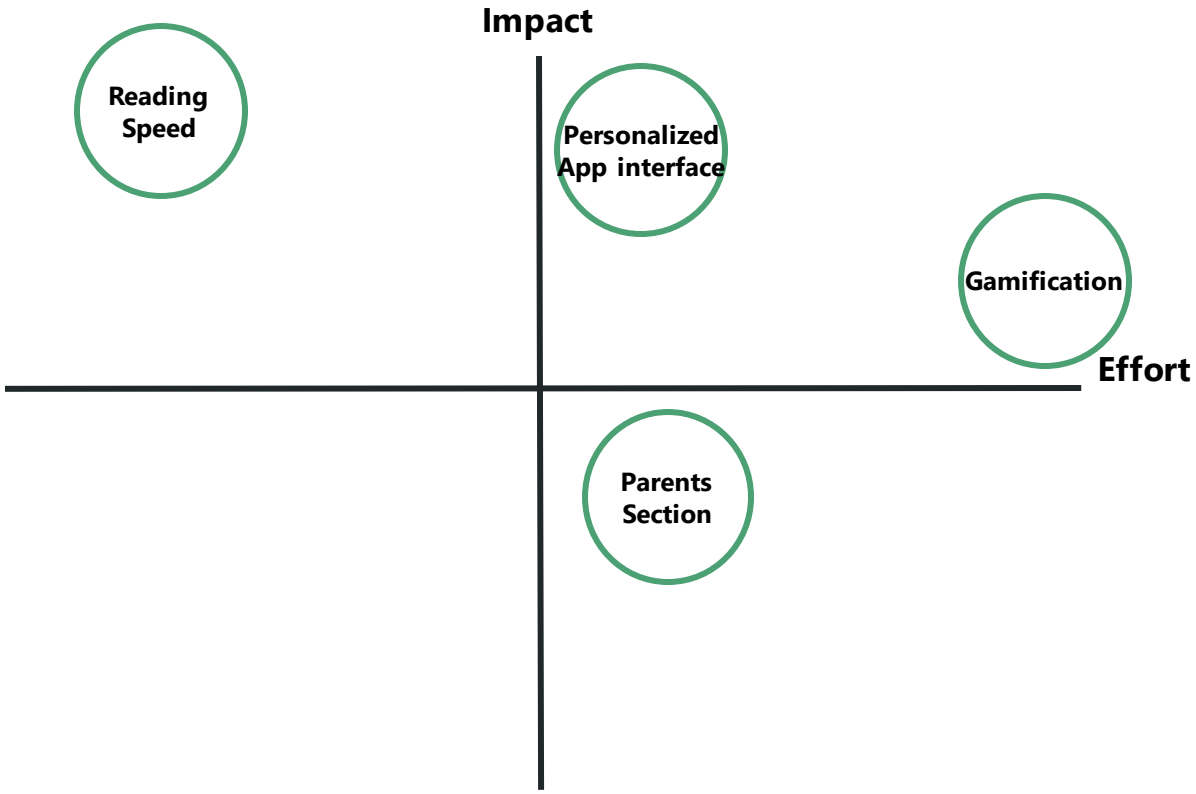

Reasoning

- In-app and In game interventions will **complete the feedback loop** for the actions performed within the app.
- Since immediate reward becomes critical in games meant for children, constant sense of achievement and results of the action performed within the app/story will ensure **better communication and engagement** with the user.
- Thus, **increasing stickiness and user engagement**

BIGFATPHOENIX
INTERACTIVE

Prioritization

Feature	Success Metrics	Priority
Reading Speed Check	Avg time to read a story	1
Personalized App Interface	Clicks on shortcuts/stickies Average # clicks to features User sign-ups Retention rate Net promoter score	2
Parents' Section	# of visits on "parents section" Retention Rate Average session duration	3
Gamification and Rewards	# of triggers per user User sign ups Retention rate	4

- Due to low effort (No/low coding effort) and high impact (Key differentiating factor b/w child and parent), Reading speed check should be implemented first
- This should be followed by a personalized app interface to ensure parents are passing on the phone to their children
