

The AI Product Manager Playbook

Speakers : Mansi Mittal
& Parth Sangani

Have you figured out who an AI PM is and how to become one?
Working on it.
Who is an AI PM? How do you become one?
AI Product Management is...

The product has to finish a customer's job.

Our fictional inbox assistant reads customer email and prepares replies for review.

Read

Permitted email and sources

Reason

Instructions and evidence

Act

Create a draft

Check

Support and approval

PM DECISION **Choose the job and acceptable consequences.**

LLMs build replies one token at a time.

A token can be a word, fragment or other processing unit.

01

Read

Email, instructions, evidence

02

Predict

Likely next tokens

03

Choose

Select and append

04

Repeat

Until a stopping condition

PM CHECK **Verify the facts behind a fluent reply.**

The answer depends on the evidence within reach.

The context window is the model's limited working space for this request.

Keep

Short thread, exact wording

Compress

Older exchanges, preserving commitments

Retrieve

Current policy and exceptions

PM REQUIREMENT **Name the facts a safe reply needs.**

Good requirements make success testable.

Turn a customer's Friday-access email into an observable acceptance test.

ACCEPTANCE CRITERIA	
Job	Prepare a supported reply.
Evidence	Current policy and account eligibility.
Boundary	Approval before sending.
Success	Missing facts trigger review.

PM OWNERSHIP **Agree on priorities, outcomes and operating limits.**

RAG brings relevant evidence into the answer.

Retrieval-augmented generation (RAG) supplies sources before the model answers.

WORKED

CASE

Illustrative

Email	"Access on Friday?"
Policy P1	"Friday access for pilot accounts."
Account A1	"Customer outside pilot."
Draft	"I'll request an eligibility review."

PM REQUIREMENT **Test policy exceptions and permitted source access.**

Search needs exact matches and meaning.

An embedding represents content as numbers so search can compare its meaning.

Keyword

Match the exact account ID AC-204.

Vector

"Get in early" matches "pilot access".

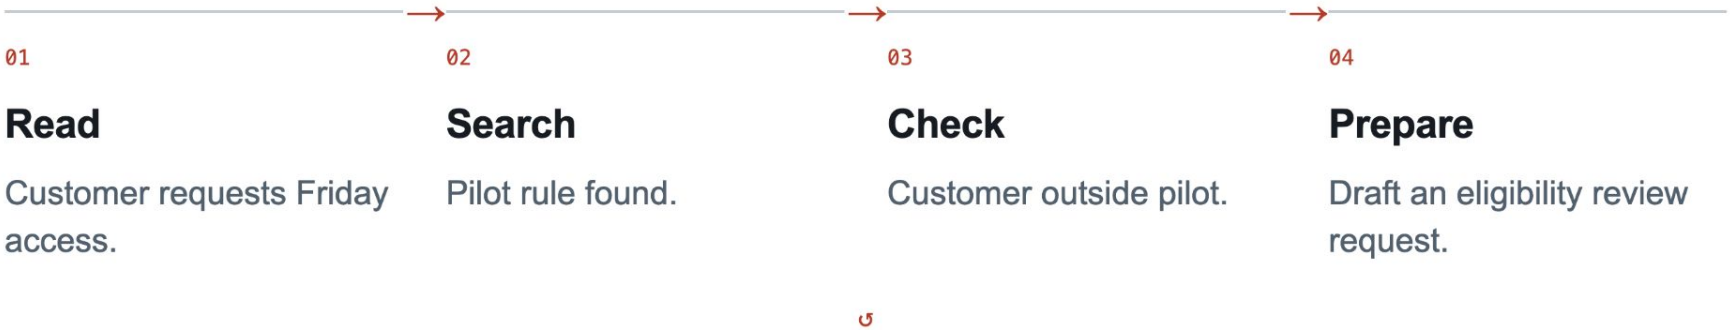

Hybrid

Combine both result lists.

PM TEST **Check identifiers, paraphrases and permissions together.**

An agent chooses its next action from feedback.

Tools perform operations; agents use their results to choose.

TEAM REQUIREMENT **Define permitted tools, stopping conditions and recovery.**

Different failures need different fixes.

Fine-tuning uses additional training to adapt model behavior.

Missing fields	Improve instructions and examples.
Old policy	Retrieve current, permitted evidence.
Inconsistent categories	Consider representative training examples.

PM DECISION **Compare against the baseline, including operating costs.**

An eval makes 'good' testable.

An eval turns an expectation into a repeatable test.

01

Case

Inputs and expected behavior.

02

Trial

One run from a fixed starting state.

03

Grader

Rules or rubric.

04

Result

Pass, fail or unclear.

PM OWNERSHIP **Define success before choosing how to score.**

Averages can hide the failures that matter.

A failure slice groups cases with a shared risk.

Missing policy	Invented promise?
Revoked access	Restricted mail exposed?
Retried send	Duplicate message?
Language variation	Unequal answer quality?

PM PRIORITY **Weigh frequency, consequences and the people bearing them.**

Product metrics start with the user's outcome.

Track the whole job, including corrections and waiting.

Quality

Supported replies; boundary failures.

Outcome

Completed replies with less rework.

Wait

Time through completion, including slow cases.

Cost

Serving costs per successful task.

PM OWNERSHIP **Define success and the cost accounting boundary.**

PMs and FDEs turn customer needs into working products.

Forward-deployed engineers (FDEs) work with customers to get AI products into use.

PM	Requirements, priorities and outcomes.
FDE	Deployment, integrations and failure visibility.
Together	Scope, quality and rollout decisions.
Product feedback	Reusable improvements from recurring problems.

WORKING AGREEMENT **Set ownership explicitly; it varies across teams.**
